

Enterprise Technology, Delivered.

Jet Technologies is a Harare-based ICT company that designs, builds and delivers enterprise systems for government and business across Zimbabwe — on time, on specification, and supported long after go-live.

Every engagement ends with a working system in production, your people trained to run it, and our team accountable for keeping it running. We combine engineering experience from regulated payments and enterprise environments with a working knowledge of how Zimbabwean institutions procure, operate and account for technology.

What We Deliver

Enterprise Asset Management — Full asset lifecycle systems: registers, barcode/tag verification, maintenance scheduling, depreciation and audit-ready reporting — anchored by our Asset Sphere platform.

Digital Government Services — Citizen-facing portals, e-services and records digitisation, including mobile-first service request platforms for local authorities.

Payments Platforms — Payment gateways, digital wallets, merchant collections and settlement platforms, engineered by a team with deep financial systems experience.

Custom Software & Integration — Systems built around your workflows and integrated with the ERP, HR and finance platforms you already run.

ICT Infrastructure & Networks — Server, network and cloud infrastructure — designed, deployed and hardened for institutions that cannot afford downtime.

Support & Managed Services — SLA-backed support, monitoring and enhancement agreements, delivered in-country.

How We Deliver

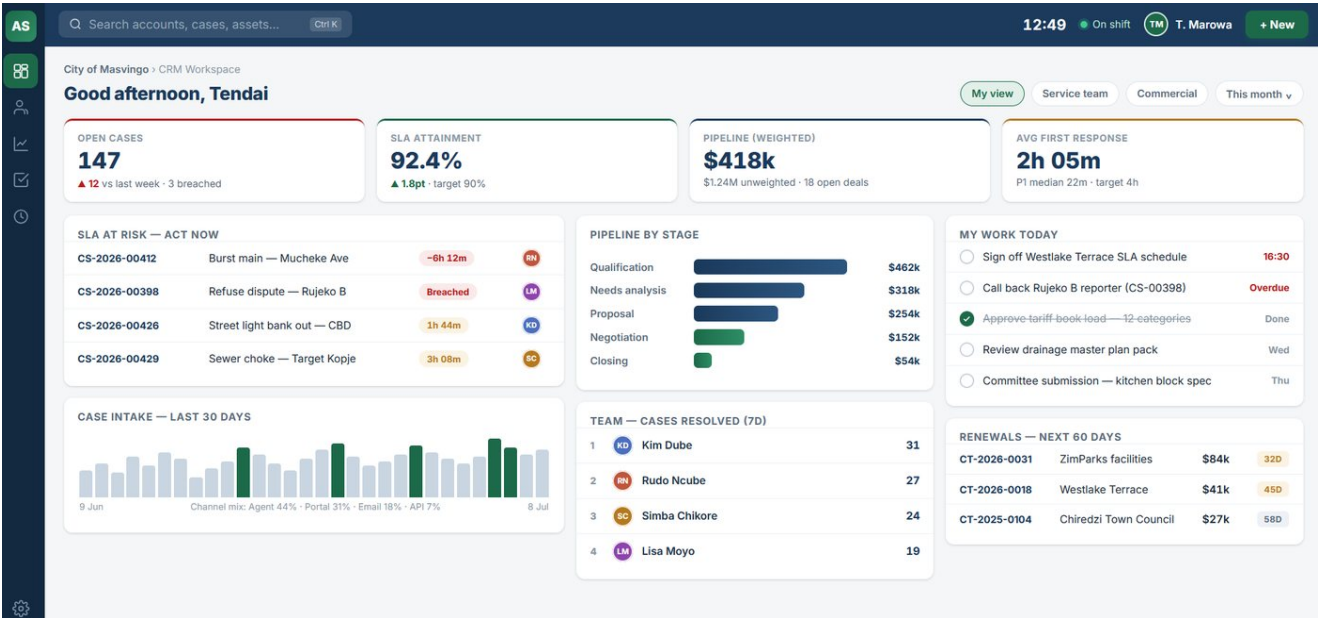

A disciplined four-stage model governs every engagement: **Discover** (operations, stakeholders and compliance mapped on the ground) → **Design** (architecture and a milestone plan you can hold us to) → **Build & Deploy** (working demonstrations at every milestone, controlled go-live, full training and handover) → **Support** (SLA-backed support, monitoring and enhancement cycles).

Why Institutions Choose Jet

In-country presence and accountability; genuine familiarity with public procurement, audit and accountability requirements; systems built around your workflows rather than imported and half-adapted; on-premises and local hosting options; training and handover included in every delivery; and pricing set for the local market.

Asset Sphere

Our flagship enterprise asset management platform: one authoritative register for everything an institution owns — verified, maintained and audit-ready.

Asset Sphere service workspace — sample data.

Platform Coverage

Complete asset registers with barcode/tag-based verification · Maintenance scheduling and lifecycle costing · Depreciation, revaluation and disposal workflows · Immutable audit trails and role-based approvals · Reporting designed for public accountability — movement schedules, verification exceptions, disposals and depreciation summaries produced on demand. Deployed on-premises, in a local data centre, or in the cloud.
